---

The remote visualization service at Cineca is provided through the Remote Connection Manager (RCM) application. Using this tool you can graphically inspect your data without moving them to your local work station.

## System requirements

The “Remote Connection Manager” has been tested and distributed for the following operating systems:

1. Microsoft: Windows 7, 8, 10
2. Linux : Ubuntu 16.04, Ubuntu 18.04, CentOS 7
3. Apple: OSX Mojave

Other Linux distributions are untested.

## Download

Download the application compatible with your operating system in the [download page](#). On linux operating system you have to make the file executable with the command "`chmod +x filename`".

## Getting started

***Please consider that RCM is a client/server application: every time you interact with the application, server side has to perform some operations that can take some time depending on bandwidth and latency of your Internet connection and workload of the clusters.***

Start the application double clicking on the application icon and insert the hostname (see the table below) and hpc username or select a previous session from the drop-down menu, then enter the hpc password "Password" and press **“Login”**.

Cluster	Hostname
GALILEO100	rcm.g100.cineca.it
MARCONI	rcm.marconi.cineca.it
M100	rcm.m100.cineca.it

RCM Client v0.1.1-79-gd868ad9

File Edit Help

Login... [X] [ + ]

Sessions: nbesker1@rcm.g100.cineca.it

Host: rcm.g100.cineca.it

User: nbesker1

Password: .....

Preload:

Login

2021-08-06 13:20:11,924 - INFO - Welcome to RCM!

If the passwordless ssh key is enabled on your account/local machine, leave "Password" field empty.

It is possible to manage different RCM ssh sessions, one for each cluster: just click on "+" button in the tab bar and insert the credentials of the new cluster:

RCM Client v0.1.1-79-gd868ad9

Working with displays

## Create a new display

To create a new display, click on the “+” button on the right:

**New display** [X]

**Job**

Scheduler: Slurm

Account: cin\_staff

Queue: g100\_usr\_prod

QoS: normal

Memory: 742

CPU: 12

Time (hour:min:sec): 02:24:00

Timeout (sec): 21

---

Service Type: VNC-1911

---

Command: TurboVNC

Window Manager: Openbox

X size: 1046

Y size: 627

Ok Cancel

#####

**RCM OLD SERVER** >> For **Marconi** cluster the info to set are:

1. Session name: insert a name for the new display
2. Select queue: select the resources to use (number of cores, amount of memory, wall-time)
3. Select wm+vnc: our suggestion is to select fluxbox as window manager for X

**New display** [X]

**Display options:**

session name:

Select queue: 12core\_40\_gb\_3h\_slurm

Select wm+vnc: fluxbox\_turbovnc\_vnc

Display size: 1024x968

Ok Cancel

Pressing **OK** into "new display" window, a remote display session will be created and you will be automatically connected to it. A TurboVNC window will be open.

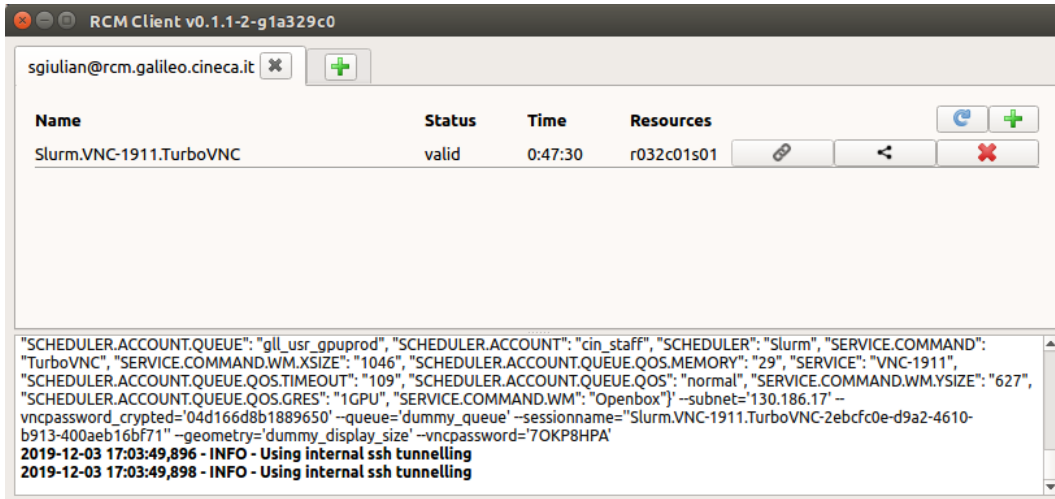

#####

This operation can take some time depending on the workload of the clusters. Now you can start your remote work session.

When a new display is created, a new item will be added to the list of available remote display sessions on the RCM tab, showing some display information that you will see below:

1. Name: name of display session
2. Status: the condition of the remote display session, *pending* (starting up the display session), *valid* (display session is running), *killing* (deleting the display session)
3. Time: the remaining time before the session will ends (if the display session has no time limit, this value is replaced by the symbol "~"). Note that each display session has a time limit: over that time limit, the display will be automatically killed and not saved data will be lost.
4. Resources: the node of the cluster on which the remote display session has been created

You can update these values by clicking on the "REFRESH" button.

## Share a display

Sharing a remote display means to give to another user the possibility to access to a specific remote display session you have created. The sharing of a remote display session is done by means of a .vnc file that as to be saved by the owner of the display session and opened by the user who has to access to the shared display session. To share a display session, click on the "SHARE THE REMOTE DISPLAY SESSION VIA FILE" button related to the remote display session you want to share. A dialog will prompt the user to select a location for saving a file. Send the saved file to the users who need to access to the shared display session. To connect to a shared display session click on the "Open" button from the "File" menu and select the received .vnc file.

## Kill a display

Display sessions can be killed by pressing the "KILL THE REMOTE DISPLAY SESSION" button. Just press the "x" button in the row associated with the remote display session you don't want to use anymore, and it will be removed from the list of the available displays. This operation can take some time, depending on the workload of the clusters. Note that by pressing it, the relative display will be not reachable anymore and you will lose not saved data.

## Running a visualization software

In order to execute a visualization software you have to load preventively the corresponding module:

```
module load paraview
```

```
paraview
```

On GPUs resources (select "SSH" or "SLURM – >gl\_usr\_gpuprod partition") you don't have to just load the visualization software module, but also virtualgl module and launch the executable through vglrun. e.g. Paraview:

```
module load paraview
```

```
module load virtualgl
```

```
vglrun paraview
```

If you selected "Openbox GPU only" window manager when you created a new display you have to only execute the visualization software through vglrun command

```
vglrun paraview
```
